

Task 1 Report: Static Webpage Using HTML and CSS

Objective

The objective of this task was to create a static webpage using HTML and CSS. The webpage was designed with a proper structure, including headings, sections, images, and styling to ensure a clean and readable layout.

Tools and Technologies Used

- HTML5
- CSS3
- Visual Studio Code (VS Code)
- GitHub

Implementation

HTML Structure

The webpage was developed using semantic HTML elements to improve readability and organization. The main components included:

- Header section with the website title
- About section containing descriptive content
- Services section listing the offered services
- Image element for visual representation
- Footer section with copyright information

CSS Styling

CSS was used to enhance the appearance of the webpage. The following styling techniques were applied:

- Background and text color customization
- Font styling for improved readability
- Proper spacing using margins and padding
- Image sizing and alignment

- Header and footer design for a professional appearance

Features

- Well-structured HTML document
- Use of headings and sections
- Inclusion of images
- Clean and user-friendly design
- Consistent styling throughout the webpage

Challenges Faced

During development, attention was required to maintain proper spacing and alignment. CSS properties such as padding, margin, and width were adjusted to achieve a balanced layout.

Conclusion

This task provided practical experience in creating a static webpage using HTML and CSS. It strengthened understanding of webpage structure, semantic elements, and basic styling techniques. The final webpage successfully met all project requirements and demonstrated fundamental front-end development skills.
