

Task 2 Report: Responsive Webpage Design

Objective

The objective of this task was to develop a responsive webpage that adapts to different screen sizes. The project focused on implementing responsive design principles using CSS media queries and layout techniques.

Tools and Technologies Used

- HTML5
- CSS3
- Visual Studio Code (VS Code)
- GitHub

Implementation

Webpage Structure

The webpage included:

- Header section with navigation menu
- Multiple content sections
- Responsive layout using Flexbox
- Mobile-friendly navigation design

Responsive Design Techniques

The following responsive design methods were implemented:

CSS Flexbox

Flexbox was used to arrange content sections efficiently and maintain alignment across different screen sizes.

Media Queries

Media queries were added to modify the layout when the screen width became smaller than 768 pixels. This allowed:

- Navigation links to stack vertically on smaller devices
- Content sections to display in a single column

- Improved readability and user experience on mobile screens

Spacing and Alignment

Margins, padding, and flexible widths were used to ensure proper spacing and consistent alignment across desktop, tablet, and mobile devices.

Features

- Responsive navigation menu
- Mobile-friendly design
- CSS media queries implementation
- Flexible layout using Flexbox
- Proper spacing and alignment
- Cross-device compatibility

Challenges Faced

One of the main challenges was ensuring that the layout remained organized on both large and small screens. Media queries and Flexbox properties were carefully adjusted to achieve a smooth transition between screen sizes.

Conclusion

This task enhanced understanding of responsive web design concepts. By using CSS media queries and flexible layouts, a webpage was created that provides a consistent user experience across different devices. The project successfully met all specified requirements and demonstrated practical responsive design skills.
